

D O S S I E R

Kampeni Intelligence Platform

Kenya's first AI-powered political intelligence & governance platform

C T O T E C H N I C A L B R I E F ·
C O N F I D E N T I A L · M A R C H 2 0 2 6

Prepared by the CEO (Morris Nyange)

1. Executive Summary

Kampeni is an AI-powered campaign intelligence and governance platform built specifically for Kenyan political contestants. It aggregates data from social media, news media, public government datasets, field agents, and polling firms — then applies AI to deliver actionable political intelligence: voter profiling, opponent analysis, message generation, resource allocation, and real-time narrative monitoring.

Post-election, the same platform pivots to a governance tool: tracking constituent pledges, monitoring approval ratings, managing petitions, and preparing for re-election from day one of the term.

This document is a technical brief for the CTO. It covers the product vision, the full feature set (incorporating best-in-class capabilities from global competitors), the system architecture, the founding team structure, the go-to-market plan, and the risk register.

WHY NOW

Kenya's 2027 general election is ~18 months away. No Africa-native, AI-powered political intelligence platform exists. The window to build credibility and close first clients before the peak campaign cycle is now.

2. The Problem & Market Opportunity

What Kenyan politicians currently do

Kenyan campaigns today are run on intuition, expensive WhatsApp consultants, and informal polling. Candidates spend tens of millions of shillings with no systematic way to understand their electorate, monitor opponents, or allocate resources intelligently. The tools that exist are either:

- Global platforms (NationBuilder, NGP VAN, Aristotle) built for US/European contexts with no Swahili NLP, no IEBC data integration, and no understanding of Kenyan political dynamics.
- Informal local consultants who do not scale, cannot be audited, and take their intelligence with them when they leave.
- Cambridge Analytica — which operated in Kenya's 2013 and 2017 elections but is now defunct and carries severe reputational risk.

The market gap

No product currently combines: Kenyan-language AI, voter intelligence, opponent analysis, field agent integration, and a post-election governance layer in a single platform. This is a genuine blue ocean in a high-value, time-pressured market.

Metric	Detail
--------	--------

Global campaign software market (2025)	USD 264.99 million, growing to USD 8.8B by 2033
Africa's share	Near zero — entirely unserved
Kenya 2027 election cycle spend (est.)	KES 50B+ across all campaigns
Platform addressable budget	1–2% of campaign spend = KES 500M–1B TAM
Nearest competitor (Africa)	Civic chatbots (CitiBot, Thoko) — not intelligence platforms

3. Product — Full Feature Set

Kamperi synthesises the best capabilities from every major competitor into a single Kenya-native platform. Below is the full feature specification.

3.1 Data Ingestion Layer

The platform's intelligence is only as good as its data. We ingest from five source categories:

Source	What we collect
Social media	X (Twitter), Facebook, TikTok — posts, comments, trends, sentiment by constituency
News media	NTV, Citizen TV, Nation, Standard, radio transcripts — scraped and indexed
Public data	IEBC voter register, Kenya National Bureau of Statistics (KNBS), Hansard (parliamentary records), county budgets
Field agents	GPS-verified door visits, voice notes, rally attendance — via offline-first mobile app
Polls & surveys	IVR, SMS, WhatsApp polls — integrated with Infotrak and TIFA data feeds

3.2 AI Intelligence Core

Borrowed from: NationBuilder (collective data model), NGP VAN (voter targeting), Aristotle (deep enrichment), Cambridge Analytica (ethical psychographic equivalent).

Capability	What it does	Kenyan adaptation
Sentiment analysis	Tracks public mood on candidate and issues	Swahili + English + Sheng NLP models
Entity extraction	Identifies people, places, promises in text	Trained on Kenyan political corpus

Voter modelling	Predicts turnout and swing likelihood by ward	Built on IEBC + census + telco data
Trend detection	Surfaces emerging narratives before they peak	Monitors WhatsApp-adjacent channels
Opponent profiling	Maps weaknesses, inconsistencies, vulnerabilities	Cross-references Hansard + media archive
Swing ward prediction	Identifies highest-ROI constituencies	County-level economic data layered in

3.3 Intelligence Modules (Candidate-Facing)

Voter Intelligence

Inspired by NGP VAN's collective voter file model — every client enriches the shared pool. Profiles built from IEBC data, mobile money behaviour patterns (via telco partnerships), census demographics, and field agent inputs. Each voter record includes: estimated issue priorities, turnout likelihood, and persuadability score.

Opponent Analysis

Continuous monitoring of all declared and likely opponents. The system tracks their public statements, Hansard voting records (for incumbents), social media, donor networks, and press coverage. Outputs: weekly vulnerability reports, inconsistency flags, and ready-to-deploy counter-messaging.

Message Engine

Inspired by GoodParty.org (rated #1 on G2 in 2025) but significantly deeper. Generates: constituency-specific talking points, attack lines backed by sourced facts, press briefing packs, debate preparation Q&A, and social media content in Swahili and English. All factual claims cite verifiable sources to avoid disinformation liability.

Resource Operations

Tells the campaign where each shilling returns the most votes. Rally scheduling optimised by ward priority scores, digital ad spend allocation by audience segment, and volunteer deployment maps updated daily based on latest intelligence.

Narrative Threat Monitoring

Borrowed from Penplusbytes' Ghana 2024 disinformation detection system. When a false or damaging narrative about the client begins trending, the platform issues an alert within minutes and auto-generates a rebuttal for review. No more being caught flat-footed by viral attacks.

3.4 Field Agent App

Borrowed from Ecanvasser's offline-first canvassing architecture. Agents receive ward-level walk lists on their phones. The app works fully offline (critical for rural constituencies) with USSD fallback, and syncs all data — GPS-verified visits, voice notes, survey responses — when connectivity is restored. AI tags sentiment from voice notes automatically.

3.5 Outreach & Communication Tools

Borrowed from CallHub's multi-channel broadcast infrastructure, rebuilt for Kenya. WhatsApp broadcast campaigns (the primary political communication channel in Kenya), SMS in Swahili/English/Sheng, IVR robo-surveys for rural reach, and AI-selected message variants per voter segment. M-Pesa integration for campaign contribution collection.

3.6 Governance Module (Post-Election)

The product's long-term revenue engine and key differentiator from pure campaign tools.

Feature	Description
Constituent CRM	Every pledge made during the campaign is logged and tracked against delivery
Petition & feedback system	Citizens submit issues via WhatsApp/SMS; AI summarises into briefing packs for the elected official
Approval sentiment monitor	Continuous tracking of public satisfaction by constituency and issue
County budget intelligence	AI analysis of budget allocations vs. citizen priorities
Re-election early warning	Flags emerging opposition, approval dips, and pledge delivery gaps 24 months before next election

4. The Product — How It Works for Everyone

Kampeni is not just a software tool. It is a political operating system that serves three distinct groups at the same time: the candidate and their campaign team, field agents on the ground, and — post-election — the citizens they govern. Understanding how each group experiences the platform is essential for building it correctly.

CORE CONCEPT	Kampeni turns raw data — social media chatter, news coverage, field reports, polling numbers, voting records — into clear decisions. What should I say in Kisumu tomorrow? Where should my budget go this week? What is my opponent about to attack me on? The platform answers these questions in real time, in plain language, in Swahili and English.
--------------	--

4.1 The Candidate — Their Daily Experience

The candidate is the primary user. They are busy, often non-technical, and making high-stakes decisions under pressure. Every feature must reach them through a single clean dashboard that delivers exactly what they need without requiring them to dig through data. Here is how a typical campaign day looks with Kampeni:

Time of day	What Kampeni delivers
6:00 AM — Morning briefing	A one-page AI brief on their phone: overnight sentiment shift in their top 5 wards, any opponent activity from the last 24 hours, the top 3 issues being discussed by the electorate, and one recommended action for the day.
9:00 AM — Rally preparation	Speaking in Mathare today. Platform surfaces: top 3 concerns of Mathare residents from social listening and field reports, talking points specific to that ward, what their opponent has previously said in Mathare, and a suggested counter-narrative.
12:00 PM — Opponent alert	Push notification: opponent just announced a bursary pledge in Embakasi. Platform auto-generates a rebuttal and three counter-talking points for the candidate to review before speaking to press.
3:00 PM — Resource decision	Campaign manager opens the dashboard: which wards need physical rallies vs. WhatsApp saturation? Swing ward scores updated with last night's field data show three wards have shifted and need urgent attention.
6:00 PM — Narrative threat	A false story about the candidate starts trending on X. Alert fires within minutes. Platform drafts a correction statement and flags the journalists who have amplified it.
Friday — Weekly strategy review	3-page strategy report: approval trend by ward, opponent momentum map, pledge delivery tracker, budget efficiency score, and recommended pivot for the following week.

4.2 The Campaign Team — Role-Specific Views

The campaign manager, communications director, and ward coordinators each have role-specific views within the same platform. No one sees more than they need; everyone sees exactly what they need to act.

Role	What they use Kampeni for
Campaign Manager	Resource allocation: budget routing, rally scheduling, volunteer deployment maps. Swing ward priority scores. Weekly strategy report generation.
Communications Director	Message engine: AI-generated press statements, social media content in Swahili and English, debate prep packs, attack line library with sourced facts. Narrative threat monitor with one-click rebuttal drafts.
Ward Coordinator	Constituent CRM for their ward: supporter profiles, outreach task lists, door-to-door walk lists. Tracks who has been contacted, what they said, what follow-up is needed.

Political Director / Analyst	Full intelligence backend: raw sentiment data, voter model outputs, opponent profiling, trend analysis. The engine room that feeds everyone else's simplified views.
Field Agents	Mobile app (see section 4.3). They are the data collectors — their inputs feed every other role's intelligence.

4.3 Field Agents — The Ground Truth Layer

Field agents are the most important data source in Kenyan politics and the most underserved by any existing tool. Kampeni gives every agent a simple mobile app that works offline, in Swahili, on any Android phone. Their job becomes structured, trackable, and directly connected to the intelligence the candidate receives at the top.

- Opens their daily task list: a prioritised walk list of households in their ward, generated by the platform based on which profiles need updating or persuasion attention.
- Logs each visit: marks household attendance, records the top concern raised from a simple dropdown (jobs, water, school fees, roads, security), adds a voice note if needed. No typing required.
- Records rally and baraza attendance: GPS-verified check-ins that feed crowd size and engagement data back to the campaign in real time.
- Submits incident reports: rumours circulating in the market, opponent activity spotted, logistics issues — all tagged by location and fed into the intelligence pipeline.
- Works fully offline in areas with no connectivity. All data queues locally and syncs the moment a connection is available. USSD fallback for feature phones. No data is ever lost.

What happens to their data: the AI aggregates field reports from all agents across all wards continuously. A pattern one agent notices in Kibera — residents asking about water supply — surfaces in the campaign manager's dashboard within hours as a rising issue in that constituency, automatically tagged and prioritised.

WHY THIS MATTERS

Every campaign in Kenya has field agents. Currently their intelligence goes into WhatsApp groups and is immediately lost. Kampeni is the first tool that captures, structures, and amplifies what field agents know. This single capability alone is transformative — and it is something no foreign competitor can replicate without being built from the ground up for this context.

4.4 The Voter — Indirect but Central

Voters do not use Kampeni directly, but they are the subject of everything the platform does. The CTO must understand the ethical architecture around voter data — not only for DPA compliance but because it shapes real product decisions: what features get built, what data fields exist, and what the AI is and is not permitted to output.

What the platform does	What the platform never does
Aggregate constituency sentiment — what issues matter in a ward	Individual psychological profiling or personality-based manipulation
Issue-based segmentation — which communities prioritise education vs. infrastructure	Ethnic targeting — no ethnicity-based segmentation feature exists anywhere in the product
Turnout and swing likelihood modelling to focus campaign resources	Voter suppression targeting — identifying likely opposition voters to avoid or discourage
Pledge tracking post-election: did the official deliver what they promised?	Selling individual voter data to third parties under any circumstance
Two-way communication: citizens submit petitions and feedback post-election	Generating disinformation, deepfakes, or fabricated quotes about any person

4.5 The Governance Module — After the Election

This is the feature that makes Kampeni a long-term company rather than a campaign-cycle product. When the candidate wins, Kampeni does not go dark. It pivots into a governance operating system for the newly elected official. This is also where the platform earns its most powerful ethical story: we do not just help people win elections. We help them govern well.

Module	How it works
Pledge tracker	Every promise made during the campaign — from speeches, manifesto, and social media — is stored and tracked against delivery. The official gets a monthly score: pledges on track, delayed, or unfulfilled. Their team logs delivery updates. This can optionally be made publicly visible for transparency and political credit.
Constituent petition system	Citizens submit issues via WhatsApp or SMS — no app download required. The AI reads, categorises, and summarises all submissions into a weekly briefing: top 5 issues raised, volume by ward, sentiment trend. The official responds at scale without reading thousands of individual messages.
Approval monitor	Continuous social listening and field-agent pulse surveys track the official's approval by ward and by issue. If approval drops sharply in a specific area

	after a specific event, the platform flags it with likely cause and a suggested response action.
Budget intelligence	AI analysis of constituency or county budget allocation vs. citizen-stated priorities. Surfaces where spending is misaligned with what residents actually want — an early warning for political risk and a governance improvement tool simultaneously.
Re-election preparation	From month 18 of the term, the platform begins building the re-election intelligence layer: tracking early opposition movements, identifying new challengers, monitoring which pledge gaps opponents will exploit, and refreshing the voter model for the next cycle.

THE PRODUCT'S BIG IDEA

Most political tools help politicians win elections. Kampeni helps them win, govern, and win again — creating a continuous relationship between the platform and the official across the full political cycle. The governance module is not an optional add-on. It is the product's most defensible long-term differentiator and its most predictable recurring revenue.

4.6 The Full User Journey — Campaign to Governance

Stage	Kampeni's role
18 months before election	Intelligence layer activates: voter profiling begins, opponent monitoring live, issue landscape mapped by constituency.
12 months before election	Message engine on: talking points drafted, early social media strategy built, ward prioritisation model ready.
6 months before election	Full campaign mode: daily briefings, resource allocation, field agent coordination, narrative threat monitoring.
Final month	War room mode: rapid-response rebuttal generation, turnout monitoring by ward, real-time results tracking support.
Month 1 post-election (winner)	Governance module activates: pledge tracker populated, constituent petition system goes live.
Months 2–54 of term	Continuous approval monitoring, constituent feedback management, budget intelligence, issue briefings.
18 months before next election	Re-election intelligence layer activates. The cycle begins again with richer data than the first time.

5. Recommended Technical Stack

This is a recommendation for the CTO's consideration — final decisions rest with the technical co-founder.

Layer	Recommended approach
-------	----------------------

Backend	Python (FastAPI) — best ecosystem for AI/ML. Microservices architecture from the start.
AI / NLP	Fine-tuned open-source LLMs (Llama 3 / Mistral) on Kenyan political corpus + Swahili datasets. OpenAI API for fallback.
Swahili NLP	Helsinki-NLP/opus-mt-en-sw base model + custom fine-tuning on Kenyan political text corpus
Data pipelines	Apache Kafka for real-time ingestion, dbt for transformation, PostgreSQL + vector DB (Pinecone/Qdrant) for semantic search
Mobile (field app)	React Native — single codebase for iOS/Android, offline-first with SQLite local storage, USSD bridge via Africa's Talking API
Frontend (dashboard)	React + TypeScript. Mobile-first, tested on low-end Android + Safaricom 3G.
Cloud / hosting	AWS Africa (Cape Town region) primary. Kenyan co-location facility secondary for DPA s.50 compliance.
WhatsApp / SMS	Africa's Talking API (SMS, USSD, voice). WhatsApp Business API via Meta or Twilio.
Authentication	Auth0 + role-based access. Candidates, campaign managers, and agents have different permissions.
Security	End-to-end encryption (AES-256 at rest, TLS 1.3 in transit). Quarterly penetration testing.

HOSTING NOTE

Kenya's Data Protection Act s.50 may require personal data on Kenyan citizens to be processed through locally-based servers. Budget for a hybrid cloud setup with a Kenyan co-location facility from day one.

6. Founding Team Structure

Note: The founding team has technical and business backgrounds but no direct political campaign experience. The Political Director role below is therefore a critical early hire — not a co-founder — who will be given appropriate title, equity, and authority to fill this gap credibly.

Role	Profile & responsibilities
CEO / Co-founder	You. Business vision, fundraising, client sales, regulatory relationships. Must build political credibility quickly through the Political Director hire and advisory board.
CTO / Co-founder	Technical co-founder. Owns AI/ML architecture, NLP models, data infrastructure, and security. Swahili NLP experience a strong plus.
Political Director (hire #1, month 1)	Ex-senior campaign strategist or political analyst. This is the most critical early hire. They train the AI on Kenyan political context, validate all outputs before client delivery, and serve as the credibility bridge with political clients. Title: Head of Political Intelligence (or equivalent that fits their preference).

Legal / DPO (hire #2, month 3)	Data Protection Officer + legal counsel. Cannot wait — ODPC registration and DPIA must be completed before any data processing begins. Combined role in early stage.
Head of Data Science (hire #3, month 5)	Voter modelling, predictive analytics, IEBC data pipelines. Academic or industry background in computational social science or political data science preferred.
Head of Growth (hire #4, month 7)	Client sales and consultant partnerships. Deep rolodex in Kenya's political consultant ecosystem. Hired once MVP is demo-ready.

Advisory Board

Non-executive, compensated in equity (0.25–0.5% each):

- Retired senior politician — credibility and network access with active candidates
- Polling firm partner — Infotrak or TIFA; data integration and joint go-to-market
- Data ethics expert — civil society representation; essential for trust-building with IEBC and media
- Diaspora tech investor/mentor — Silicon Savannah network and international fundraising connections

FOUNDER NOTE

The CEO does not need to have personal political experience — but must hire someone who does within the first 30 days. Every client conversation before that hire should be led by or co-led with the Political Director once onboarded.

7. Go-to-Market Strategy

Phase	Plan
Phase 1 — PoC (months 1–6)	Target 2–3 Nairobi MCA / ward rep candidates at free or heavily subsidised access. Objective: build case studies and a reference base. Deliver 3 core features only: sentiment dashboard, opponent tracker, daily AI briefing. Partner with 1–2 existing political consultants as resellers.
Phase 2 — County rollout (months 7–18)	Scale to MP, Senator, Women Rep candidates. Introduce tiered pricing: Starter KES 30k/mo, Pro KES 120k/mo, Campaign KES 500k+. Expand to 5 target counties: Nairobi, Mombasa, Kisumu, Nakuru, Eldoret. Integrate Infotrak/TIFA data feeds.
Phase 3 — 2027 election blitz (months 18–30)	Enterprise contracts for gubernatorial and presidential campaigns (KES 5M+). Real-time war room dashboards with 24/7 analyst-plus-AI support. Begin Pan-Africa conversations: Uganda, Tanzania, Nigeria.
Phase 4 — Governance SaaS (post-election)	Winners convert to governance subscriptions. Sell anonymised aggregate data insights to think tanks, NGOs, and media houses as a secondary revenue stream.

Pricing rationale

Anchor pricing to campaign budgets, not software market norms. A gubernatorial candidate spending KES 100M on their campaign will spend KES 500k/month on intelligence without hesitation if it demonstrably moves votes. Do not underprice in an attempt to compete with free consultants — it signals the product is not serious.

8. Competitive Landscape

Kampeni operates in a genuine blue ocean — no competitor combines AI-powered political intelligence with Kenyan market localisation. The landscape breaks into four clusters:

Competitor	Their strength	Our advantage over them
NationBuilder	Community CRM, supporter profiles, integrated website	We add AI intelligence, opponent analysis, and Swahili NLP they will never build
NGP VAN	Collective voter file, deep targeting, data enrichment	We replicate their data model for Kenya using IEBC + local sources
Aristotle	1,000+ demographic attributes on voter profiles	We replicate with Kenyan data: telco, M-Pesa, census, county economic data
Ecanvasser	Offline-first field agent app	We adopt this architecture entirely — they have no Africa presence or Kenyan data
CallHub	Multi-channel voter outreach, predictive diallers	We rebuild natively for WhatsApp + SMS + USSD in Kenya's connectivity reality
GoodParty.org	AI campaign content (rated #1 G2 2025)	We add opponent analysis and governance — they have neither
Penplusbytes	Disinformation detection (Ghana 2024)	We integrate this capability — they are civic, not commercial
Cambridge Analytica†	Deep voter psychographics and micro-targeting	We replicate ethically using consented, issue-based (not psychological) targeting
Local consultants	Trust, relationships, cultural knowledge	We augment consultants as partners/resellers — not competitors

9. Risk Register

Risk	Severity	Mitigation
Kenya Data Protection Act non-compliance	CRITICAL	Register with ODPC before launch. Appoint DPO at month 3. Conduct DPIA. Obtain explicit consent for all personal data processed.

Data breach / security incident	CRITICAL	End-to-end encryption (AES-256/TLS 1.3). Quarterly pen testing. Kenyan-hosted servers for DPA s.50. 72hr breach notification protocol.
Cambridge Analytica reputational shadow	HIGH	Brand as transparency-first, Kenyan-owned. Publish ethical charter publicly. Refuse clients requesting disinformation, suppression, or ethnic targeting tools.
Platform used for ethnic manipulation	HIGH	Hard-code content guardrails in AI outputs. No ethnicity-targeting features. Client terms prohibit ethnic targeting explicitly. Independent ethics board.
AI-generated disinformation	MEDIUM	All factual claims cite verifiable sources. Block deepfake generation capability. Partner with Africa Check for fact-verification API integration.
Election interference accusations	MEDIUM	Proactively brief IEBC and ODPC before launch. Offer platform access across party lines. Maintain independent ethics board with civil society seats.
Regulatory crackdown on AI in politics	MEDIUM	Engage Communications Authority and IEBC early. Shape the regulation rather than react to it. Being the compliant incumbent is a competitive moat.
Client loses election, churn risk	LOW	Sell to both sides of competitive races where possible. Frame value as intelligence, not victory guarantee. Governance module keeps winners as subscribers.

10. Immediate Next Steps (First 90 Days)

When	Action
Week 1–2	CTO and CEO align on technical architecture and stack choices based on this brief
Week 2–4	Begin Political Director search — this is the single highest-priority hire
Month 1	Engage data protection lawyer; begin ODPC registration process
Month 1–2	Begin Swahili NLP model selection and training data curation
Month 1–2	Identify 2–3 MCA-level PoC candidates in Nairobi for first pilots
Month 2–3	Build MVP: sentiment dashboard + opponent tracker + daily AI briefing only
Month 3	Appoint Legal/DPO. Complete DPIA. Begin ODPC registration formally.
Month 3	Approach Infotrak or TIFA for data partnership conversation
Month 4–5	Recruit advisory board — retired politician and data ethics expert first
Month 5	Begin Head of Data Science search
Month 6	Launch PoC with first 2–3 clients. Gather structured feedback.

**BUILD
PHILOSOPHY**

Mobile-first. Low-bandwidth-aware. Bilingual by default (Swahili + English). Every screen must work on a KES 8,000 Android phone on Safaricom 3G without training. This constraint, held firmly throughout development, is your deepest moat against any foreign competitor entering this market.

This document is confidential and intended solely for the founding team. March 2026.
